

# ETS im Policy Mix

Das EU-Emissionshandelssystem auf dem Reform-Prüfstand  
Berliner Energietage, 29 April 2015

Dr. Martin Cames

# Assumptions

- Climate change is the greatest challenge for mankind
- To prevent dangerous, non-linear climate changes, the global temperature increase needs to stay below 2°C
- To achieve this, developed countries need to decarbonize their economies almost entirely by 2050, i.e. 35 years remaining
  - Technologically this is challenging but possible
  - Requires also behavioral change, i.e. reduced material consumption
- Quantity control instruments are an important option to
  - achieve the environmental goal
  - provide incentives for technological and behavioral changes

# Expectations

- Put a price on greenhouse gases
- Internalize climate externalities
- Reduce emissions in the covered sectors
- Drive investment towards carbon friendly technologies
- Incentivize innovation
  - One major aim of the European Union Emissions Trading Scheme (EU ETS) is “promoting global innovation to combat climate change” (DG ENV 2004).
  - “The analysis of the EU ETS has revealed some indications that the instrument has basically worked as originally intended although it has certainly not yet developed its full potential in terms of promoting innovation towards a more climate friendly electricity system.” (Cames 2010)

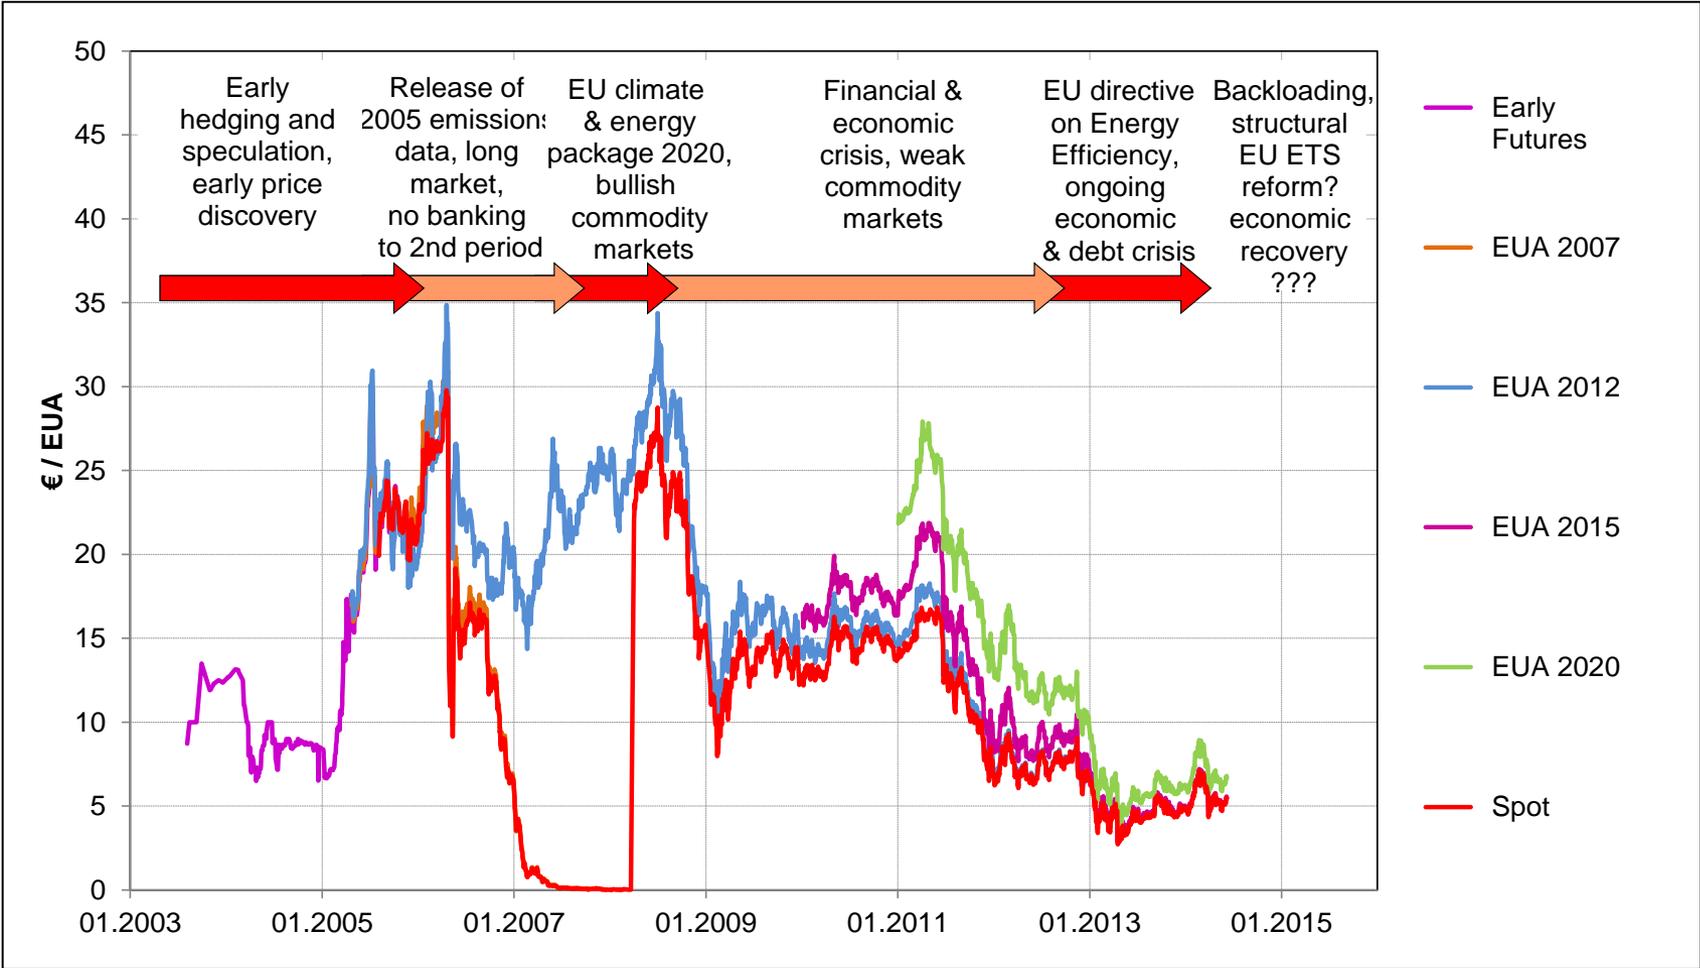

# Own expectations

## Preliminary conclusions

- The term “innovation” is more linked to technical innovation, institutional changes are mostly not considered as innovations
- We can differentiate two dimensions of impacts of emissions trading on innovation
  - Before start of the emissions trading mainly “soft” innovations without large investment decisions (establishment of a task force, calculating avoidance cost curves and sketching scenarios, adaptation of software etc.)
  - “Hard” innovations with larger needs for financial resources will actually be postponed and will only be put on the agenda again when first experiences with emissions trading are gained (new power plants etc.)
- In this respect emissions trading has quite innovation delaying effects
- The importance of the “discovery function” of emissions trading is considered to be very small in the companies
- In general, the innovation effects are underestimated in the companies right now
- Finally, the innovation effects will be only visible in the long term

# Reality

- Surplus of units (2.1 billion units)
- Declining carbon prices
  - Lingering since 2 years around 5-7 €/t
  - However, prices are not at zero
  - Transactions volumes are significant, i.e. liquid market
- Price volatility
- Lack of incentives towards carbon friendly technologies

## Potential reasons

- Global financial crisis after 2008
- Renewables policy
- Energy efficiency policy
- Offsets, particularly Certified Emission Reductions (CER) from the Clean Development Mechanism (CDM)
- Expectations of market participants
  
- In other words
  - ETS has worked as expected
  - Framework conditions developed differently than expected

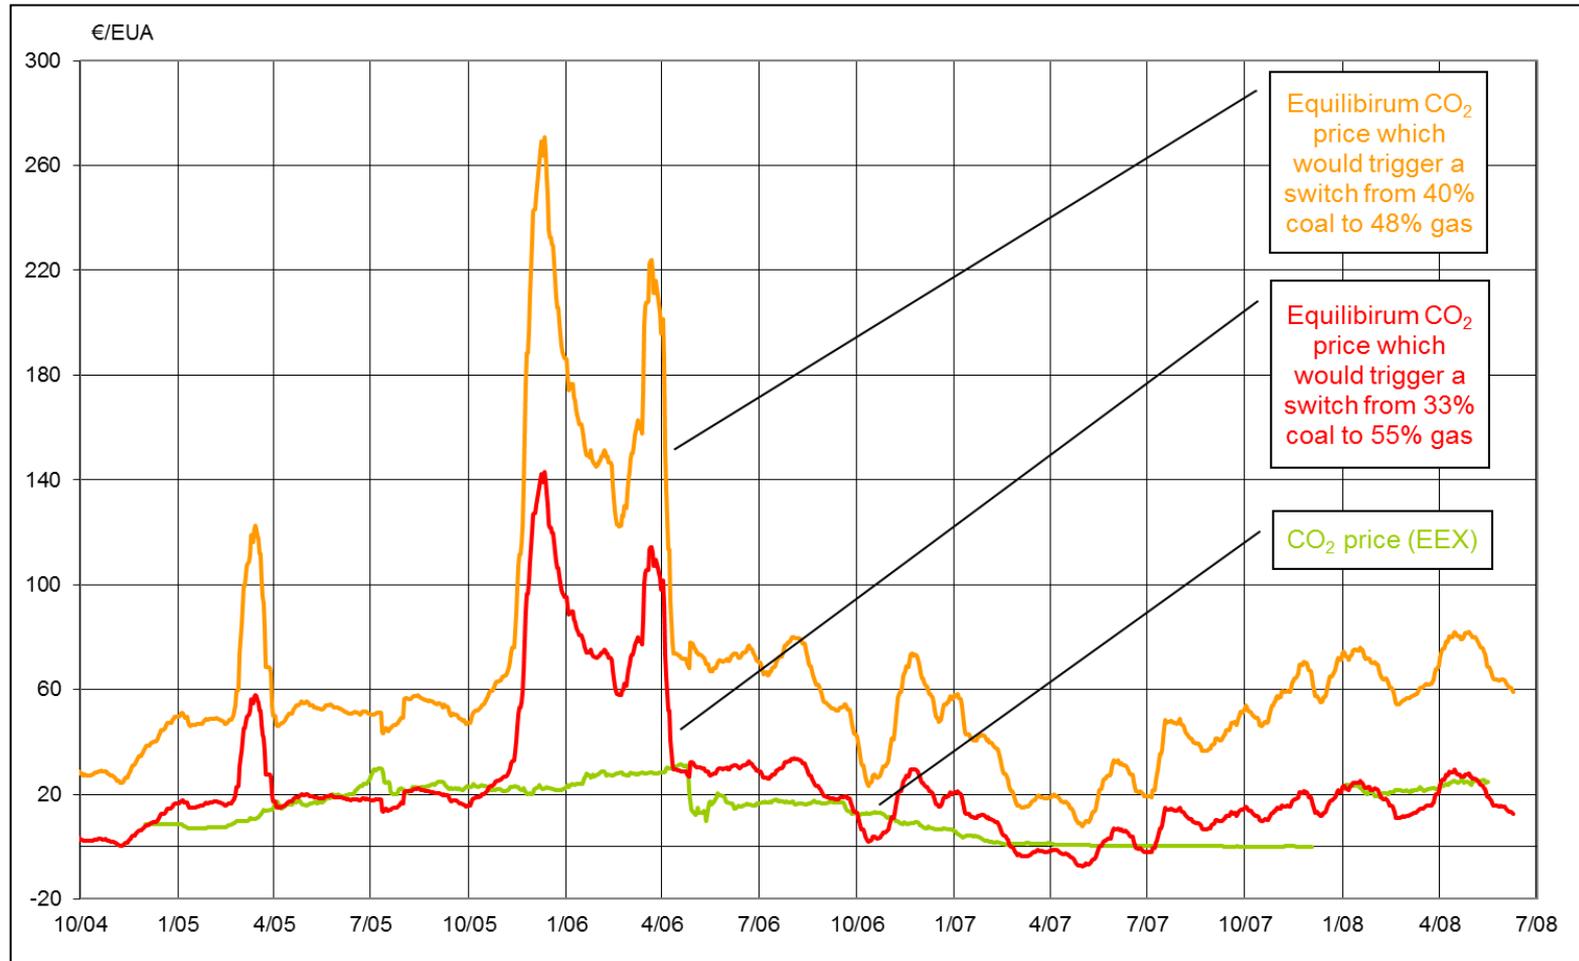

# What went wrong?

- In the design
  - Generous allocation: 2005-2007 & 2008-2012
  - Linking directive: further implicit extension of the cap
  - Free allocation: investment subsidy for coal/lignite plants
  - Ban on other GHG regulation in covered installations
  
- In the analysis
  - Ignoring the time period required to swing-in
  - Focus on actual surplus
  - Focus on carbon prices
  - NGO (E & B) “shit storm” based on unjustified expectations

## Potential reforms

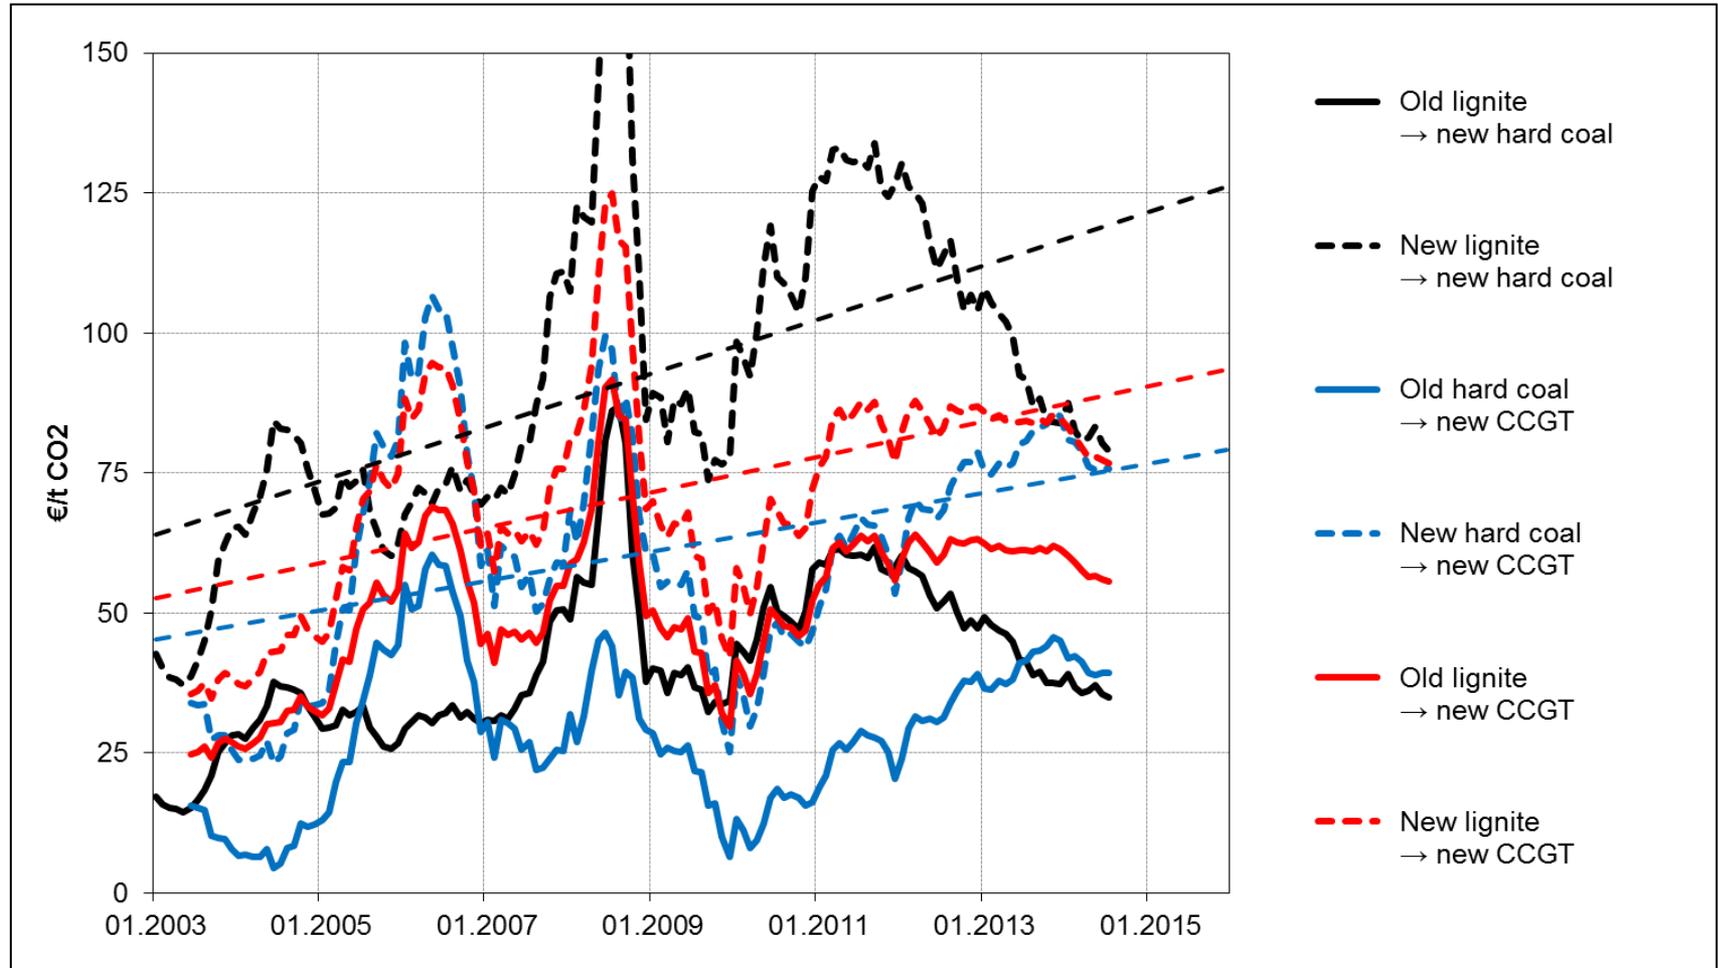

- Price oriented
  - Backloading
  - Establishing a price corridor
    - Discretionary intervention to stay within the corridor
    - Establishing an independent body similar to the ECB
- Quantity oriented: Strengthening the Linear Reduction Factor (LRF): from 1.74 %/a to 2.2 - 3.0
- Hybrid: Market Stability Reserve (MSR)
  - Rules based, no discretionary quantity control
  - Cancelling (parts of the) reserve in the longer term?
- Other: extending coverage (upstream: transport, buildings)

# Coal to gas switch band – years ago

# Hypotheses

- Enforcing a GHG mitigation target by law was more important (generating vested rights of many individuals) than putting a price on GHG (internalization)
- Low prices are rather an indicator that reduction efforts can be increased than that ETS is working wrong
- The swing-in phase of a new market instrument has been entirely ignored
- Therefore, the EU ETS cannot drive investment into low carbon technologies in the short run
- The time remaining to decarbonize the economy is too short to drive climate friendly investment through the ETS only
- ETS needs flanking instrument which promote renewables and ensure the phase out of fossil fuel (particularly hard coal and lignite) within 30 years
- Paradoxically: measures flanking the ETS will at the same time undermine any effort to increase the carbon price

# Policy mix for decarbonization

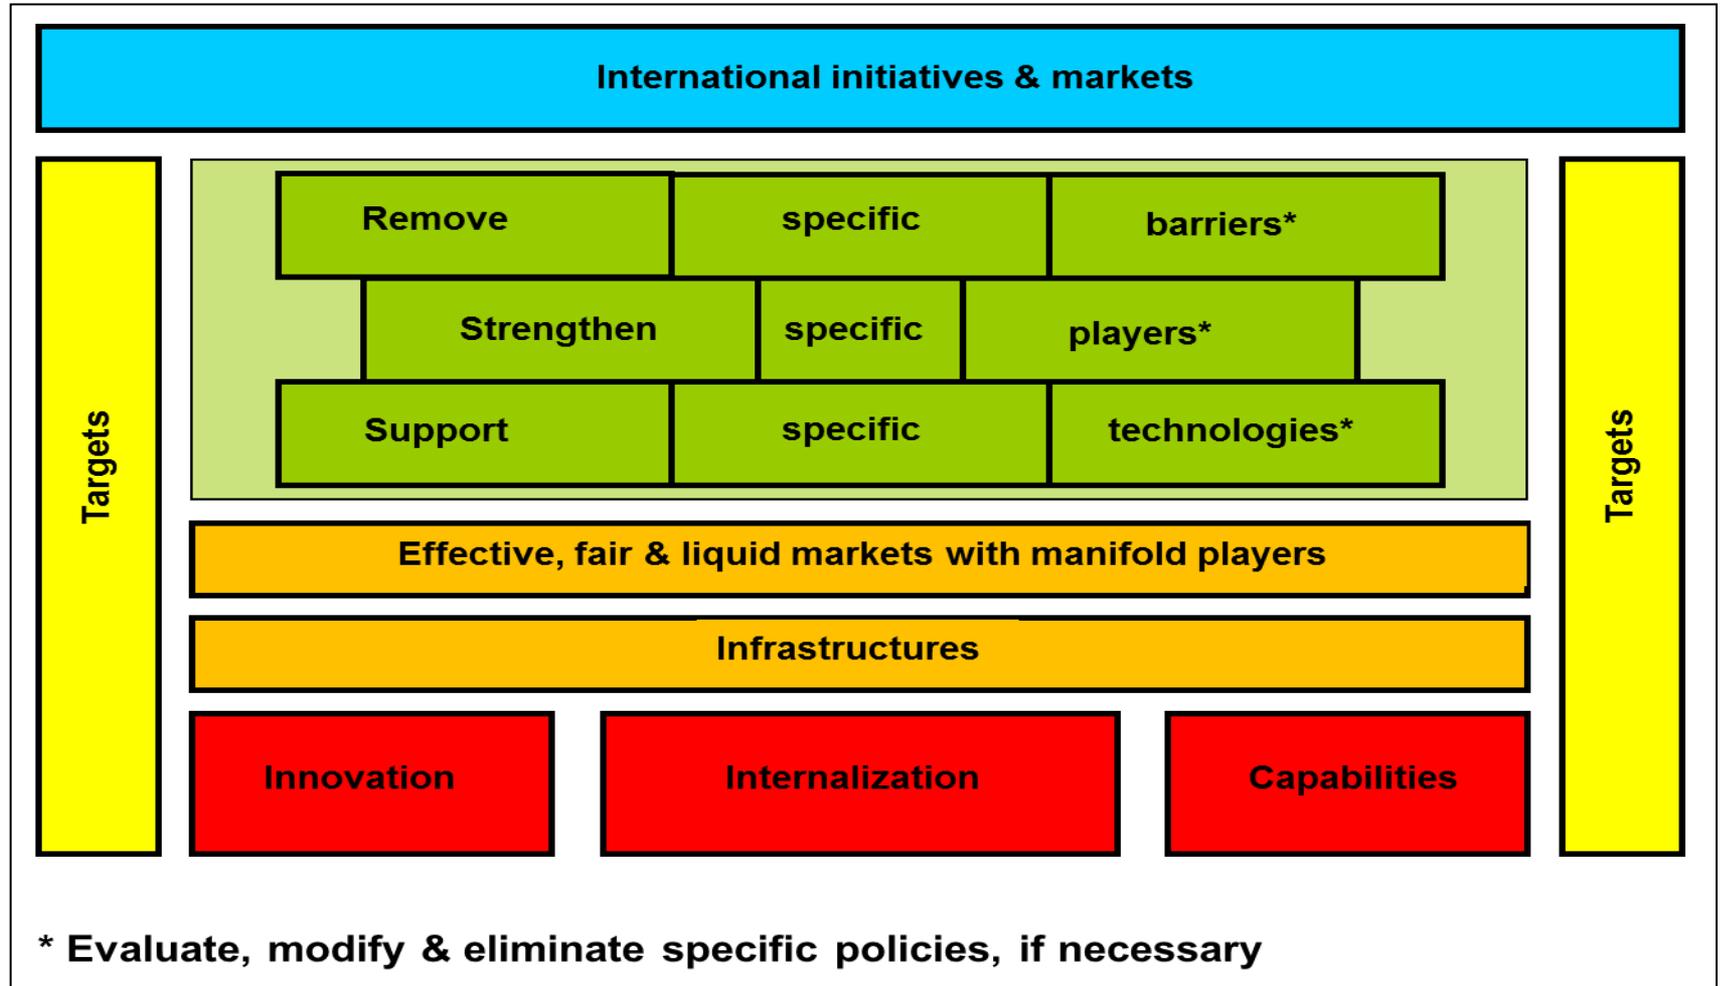

Source: Öko-Institut 2010

## Revision of expectations

- ETS is unlikely to achieve GHG prices required to trigger investments towards decarbonization, at least not in the timespan remaining to achieve decarbonization
- Price oriented reforms tend to be rather cosmetics
- Should the EU ETS than be scrapped? No, the long term cap established through the LFR provides trust to long-term climate policy goals also in other sectors (spill-over)
- Focus should be put on quantity regulations (strengthening the LFR) rather than on price regulations
- Additional purpose of ETS:  
provide incentive for short term dispatch

# Strategies with the policy mix

Source: Öko-Institut 2010

# Conclusions

- Nature of climate policy: drastic emission reduction targets
  - Transformational rather than incremental
  - Radical innovation required
  - Windows of opportunities for (cost-efficient) emission reductions in durable capital stocks
- Interdependencies, feedbacks (coal prices, electricity exports, etc.)
- ETS needs to be embedded in a policy mix which drives investments into renewables and ensures the phase out of fossil fuels
  - Supply side: expanding mitigation options (feed-in tariffs, etc.)
  - Demand side: limiting emission options (ETS, scrapping tools, etc.)

# Thank you for your attention!
